

The interior department of the Consell de Formentera, whose remit includes the island's beach lifeguard and rescue service, reports that the service's annual halt in summer operations took place last week. The team worked from May 1 to October 31. For six months, a team that numbered as many as 23 lifeguards worked to assure the safety of Formentera's beaches and swimming areas. Department head Josep Marí applauded lifeguards' efforts, underscoring the "dedication and professionalism" of the team.

Incidents in summer 2019

Lifeguards responded to 2,753 cases involving everything sun burns to spills, cuts, scrapes and bumps. They also assisted in stings by greater weever (a poisonous fish), sea urchins and jellyfish—at 2,264, this last group was the largest.

Thirty-nine individuals were rescued from potentially dangerous situations in the water, a type of rescue most common when the yellow flag flies, which means beachgoers can still swim but are encouraged to apply caution, something some fail to take into account. Likewise, a total of 24 people were taken to hospital in ambulance.

The interior office is saddened to report on loss of life—the victim was struck by a moving vehicle—near Cavall d'en Borràs beach this July. Red-flag days, when swimmers are expressly banned from entering the water, made up for 46 days this summer.

Formentera beaches: accessible and equipped for heart-attack response

Arenals and Es Pujols beaches feature accessible-swimming options for individuals with reduced mobility. The service, available from 12 noon to 5.00pm when the green flag flies, was requested this year by 36 people. All lifeguard posts without exception are fitted with defibrillators to assist in cases of possible cardiopulmonary arrest.
